

Used Forklift Parts

In due course, lift truck parts would wear and need to be replaced. Buying brand new components can become a pricey undertaking so another idea is to purchase used lift truck components. This can save much money in the end. It is a good idea to purchase used forklift parts that have been remanufactured. These parts would ensure that you are getting parts that will work for a long time and be productive.

Broken or worn parts which are reproduced are a very cost effective answer compared to rebuilding. With rebuilding parts, just the parts which are broken or worn out get replaced, which means that other wearable parts might break down soon after acquisition.

Remanufacturing however offers the best assurance for used parts. Reproduced components are taken apart and cleaned and then all wearable pieces are replaced. All wearable parts are replaced regardless of age or wear which is one more reason why remanufactured components overall operate so much better. Whichever part within the part is brand new and this offers far longer life to the used part. Based on the forklift parts that are being redone, the cleaning process and the whole remanufacturing process will differ.

The engines are cleaned after a complete disassembly. Different engine parts like rings, pistons, spark plugs, valve springs, filters, and valves can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to ensure that there are no leaks, no noises, no oil pressure problems or any vacuum.

Transmissions are one more item which is oven cleaned after being disassembled. The transmission is then washed. A thorough inspection is performed in order to check for any cracks. Bushings, seals and bearings are all replaced. Typically, the replacement parts used on transmission components meet OEM specifications.

A few forklift components like for example the alternator, the water pump, torque converters, steer axles and the starter can be quite serviceable after worn components are replaced. The electronic control in the electric forklift is maintained by the control card. This card can even be reproduced with replacing all aged and worn out parts. Unlike various forklift components the control card could only have the worn and aged components replaced.

Remanufactured components are thoroughly examined upon reassembly to ensure they are in top condition previous to being sold. It is important when obtaining reproduced parts to be sure they have undergone the proper testing and inspection procedures. On certain bigger components like transmissions, steer axles and engines, OEM specification replacement parts must be used.

The dealer of used lift trucks and components could ensure that the remanufactured components have met OEM specifications and that these parts meet industry standards. Lots of details go into remanufacturing second-hand parts. This attention to detail offers more serviceability out of reproduced components than the components that were simply rebuilt.
